### **Embedding Servo**

### Combination of:

- Architectures
- GPU
- Languages
- Distribution (Toolkits/Frameworks/Packaging)

# Abstraction layer:

- servo crate: limited to pure Rust, (Rust structs and channels). components/servo
- simpleservo: wrapper around servo crate. C API, simple callbacks mechanism. *ports/libsimpleservo*
- servoview: wrapper around simpleservo. Includes platforms specific initialization code, events translation and hooks. *supports*/

## Targets

- CPUs: x64 (Windows, Linux, Mac), ARM, Windows/UWP
- GPU: OpenGL 3.2, GLES 3.0, D3D via mozangle/MSAngle
- Languages: Rust, C/C++, Java, C#
- Distribution:
  - C library (.so + .h). ARM + x64
  - Rust crate (not on <u>crates.io</u> yet)
  - Android package (.aar via Maven)
  - WIP: NuGet package

# How to embed Servo

- Provide an OpenGL/EGL buffer and associated functions (swap\_buffers and make\_present)
- "Execute in GL Thread" callback
- Provide dependencies (gstreamer and openssl)
- Platform eventloop integration
- Translate platform events to servo events
- Optional: Provide a rust-webvr backend

# Challenges

- As API gets more complex, the C API gets less "flat and simple"
- Single compositor assumption
- startup needs to happen in the GL thread
- Interaction with content
- Immersive Mode
- Drop Glutin port: use libsimpleservo on Desktop, build native apps, introduce tabs (that we actually support) and multi windows

#### Rust (programming language)

Rust is a systems programming language sponsored by Mozilla Research. It is designed to be a "safe, concurrent, practical language", supporting functional and imperative-procedural paradigms. Rust is syntactically similar to C++, but is designed for better memory safety while maintaining performance. More at Wikipedia

Including results for rust **language**. Search only for rust "lang"?

#### Servo, the Parallel Browser Engine Project

**Servo** is a modern, high-performance browser engine designed for both application and embedded use.

Sponsored by Mozilla and written in the new systems programming language **Rust**, the Servo project aims to achieve better parallelism, security, modularity, and performance.
